

# Subqueries

# Objectives

After completing this lesson, you should be able to do the following:

- Describe the types of problem that subqueries can solve
- Define subqueries
- List the types of subqueries
- Write single-row and multiple-row subqueries

# Using a Subquery to Solve a Problem

Who has a salary greater than Abel's?

**Main Query:**

**Which employees have salaries greater than Abel's salary?**

**Subquery**

**What is Abel's salary?**

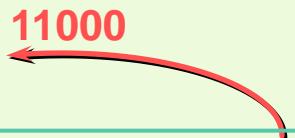

## Subquery Syntax

```
SELECT    select_list
FROM      table
WHERE     expr operator
          (SELECT      select_list
           FROM         table);
```

- The subquery (inner query) executes once before the main query.
- The result of the subquery is used by the main query (outer query).

## Using a Subquery

```
SELECT last_name
FROM employees
WHERE salary >
      (SELECT salary
       FROM employees
       WHERE last_name = 'Abel');
```

LAST_NAME
King
Kochhar
De Haan
Hartstein
Higgins

## Guidelines for Using Subqueries

- Enclose subqueries in parentheses.
- Place subqueries on the right side of the comparison condition.
- The `ORDER BY` clause in the subquery is not needed unless you are performing Top-N analysis.
- Use single-row operators with single-row subqueries and use multiple-row operators with multiple-row subqueries.

## Types of Subqueries

- **Single-row subquery**

- **Multiple-row subquery**

## Single-Row Subqueries

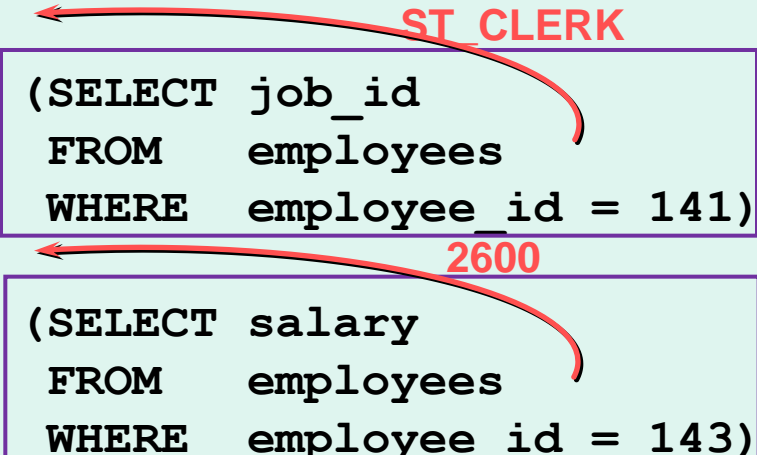

- Return only one row
- Use single-row comparison operators

Operator	Meaning
=	Equal to
>	Greater than
>=	Greater than or equal to
<	Less than
<=	Less than or equal to
<>	Not equal to

## Executing Single-Row Subqueries

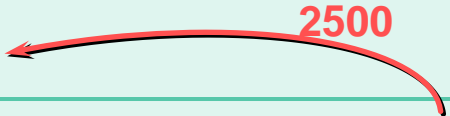

```
SELECT last_name, job_id, salary
FROM employees
WHERE job_id = (SELECT job_id
                 FROM employees
                 WHERE employee_id = 141)
AND salary > (SELECT salary
               FROM employees
               WHERE employee_id = 143);
```

LAST_NAME	JOB_ID	SALARY
Rajs	ST_CLERK	3500
Davies	ST_CLERK	3100

## Using Group Functions in a Subquery

```
SELECT last_name, job_id, salary
FROM   employees
WHERE  salary =
      (SELECT MIN(salary)
       FROM   employees);
```

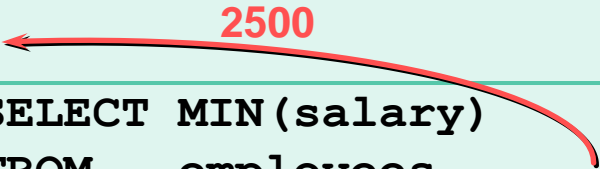

LAST_NAME	JOB_ID	SALARY
Vargas	ST_CLERK	2500

## The HAVING Clause with Subqueries

- The server executes subqueries first.
- The server returns results into the HAVING clause of the main query.

```
SELECT  department_id, MIN(salary)
FROM    employees
GROUP BY department_id
HAVING  MIN(salary) > (SELECT MIN(salary)
                       FROM    employees
                       WHERE    department_id = 50);
```

The diagram illustrates the execution of the SQL query. A red arrow points from the value '2500' (the result of the subquery) to the condition 'MIN(salary) >' in the HAVING clause, indicating that the subquery's result is used to filter the main query's results.

What is Wrong  
with this Statement?

```
SELECT employee_id, last_name
FROM employees
WHERE salary =
      (SELECT MIN(salary)
       FROM employees
       GROUP BY department_id);
```

```
ERROR at line 4:
ORA-01427: single-row subquery returns more than
one row
```

**Single-row operator with multiple-row subquery**

Will this Statement Return Rows?

```
SELECT last_name, job_id
FROM employees
WHERE job_id =
      (SELECT job_id
       FROM employees
       WHERE last_name = 'Haas');
```

no rows selected

**Subquery returns no values**

## Multiple-Row Subqueries

- Return more than one row
- Use multiple-row comparison operators

Operator	Meaning
<b>IN</b>	Equal to any member in the list
<b>ANY</b>	Compare value to each value returned by the subquery
<b>ALL</b>	Compare value to every value returned by the subquery

## Using the ANY Operator in Multiple-Row Subqueries

```
SELECT employee_id, last_name, job_id, salary
FROM employees
WHERE salary < ANY
      (SELECT salary
       FROM employees
       WHERE job_id = 'IT_PROG')
AND job_id <> 'IT_PROG';
```

9000, 6000, 4200

EMPLOYEE_ID	LAST_NAME	JOB_ID	SALARY
124	Mourgos	ST_MAN	5800
141	Rajs	ST_CLERK	3500
142	Davies	ST_CLERK	3100
143	Matos	ST_CLERK	2600
144	Vargas	ST_CLERK	2500

■■■  
10 rows selected.

## Using the ALL Operator in Multiple-Row Subqueries

```
SELECT employee_id, last_name, job_id, salary
FROM   employees
WHERE  salary < ALL
      (SELECT salary
       FROM   employees
       WHERE  job_id = 'IT_PROG')
AND    job_id <> 'IT_PROG';
```

9000, 6000, 4200

EMPLOYEE_ID	LAST_NAME	JOB_ID	SALARY
141	Rajs	ST_CLERK	3500
142	Davies	ST_CLERK	3100
143	Matos	ST_CLERK	2600
144	Vargas	ST_CLERK	2500

## Null Values in a Subquery

```
SELECT emp.last_name  
FROM   employees emp  
WHERE  emp.employee_id NOT IN  
                                (SELECT mgr.manager_id  
                                FROM   employees mgr)
```

no rows selected

## Summary

In this lesson, you should have learned how to:

- Identify when a subquery can help solve a question
- Write subqueries when a query is based on unknown values

```
SELECT    select_list
FROM      table
WHERE     expr operator
          (SELECT select_list
           FROM    table);
```
